OLUSANYA TIMOTHY

Software Engineer, AI Evaluation & Safety Tooling

Lagos, Nigeria (UTC+1) | olusanyatimothy54@gmail.com | github.com/Teamthy | linkedin.com/in/olusanya-timothy

Open work: github.com/Teamthy/ai-redteam-five-tests (five-test AI red-team harness)

SUMMARY

Software engineer who builds and tests AI systems for AI safety, from the build-and-test side. I design and run reproducible evaluations that check whether an LLM does what it should under real-world and adversarial conditions, and I write the harnesses so every result traces back to a specific prompt, model, and commit. I ship clean, tested, documented Python that other engineers build on, and I work with LLMs beyond single API calls: evaluations, tool-calling and agentic scaffolding, and retrieval. Author of Breaking AI, a public series on shipping AI that survives real users, and maintainer of an open-source five-test red-team harness. Self-taught, motivated by AI safety and by work I can verify.

AI SAFETY EVALUATION & TOOLING

- Built an open-source five-test red-team harness (github.com/Teamthy/ai-redteam-five-tests) that runs prompt injection, retrieval poisoning, tool-description poisoning, and multilingual refusal tests against any OpenAI-compatible model, resolves tool calls, records raw responses, and reports each failure with its sample size and rate. Written as clean, tested, documented Python a small team can extend, not a one-off script; every run is reproducible and traces back to a commit.
- Built a customer support chatbot (LLM API, system prompts, tool wiring) and ran six structured prompt-injection tests before launch; four succeeded (system prompt leakage, an unauthorized refund commitment, a policy bypass). Fixed each and converted the findings into a repeatable pre-launch checklist.
- Write Breaking AI, a public 21-part series documenting reproducible AI failure modes with the exact test inputs and the controls that stop them. Articles 1 and 2 published (Oct 6 and Oct 13, 2026).
- Trained in NIST AI risk and safety frameworks. Background in computer vision model evaluation and image data workflows.

SKILLS

Python (evaluation harnesses, testing, data pipelines) | LLM integration (OpenAI-compatible APIs, tool/function calling, agentic scaffolding, retrieval/RAG) | Security (secret and credential handling, access control, adversarial testing) | Reproducibility (versioned runs, traceability, sampling) | Go, Node.js, TypeScript | Git

EXPERIENCE

Software Engineer, AI Integration & Red Teaming | Teamart.inc

Lagos, Nigeria | July 2025 - Present

- Build and ship AI features for client products: LLM chatbots, retrieval pipelines, and tool-calling workflows.
- Write clean, tested, documented code that other engineers build on, and own features through deployment.
- Run pre-launch red teaming (prompt injection, unauthorized actions, policy bypass) and deliver prioritized findings with fixes.

Senior Developer | YKAY ConsultingHub

Lagos, Nigeria | Nov 2024 - June 2025

- Led backend development in Go and Node.js; designed REST APIs and multi-role authentication (JWT, role-based access control).
- Raised code maintainability through modular architecture standards and Git-based review workflows.

PROJECTS

- EDUos, School Management Platform | Node.js, TypeScript, Next.js. Multi-role platform with authentication and dashboards; fixed an authorization flaw that exposed data across roles, then hardened the access model.
- Nigeria LandSecure, Land Verification | Go, Next.js, PostgreSQL. Document verification with role-based permissions; resolved concurrency failures with transaction handling and row locking.

EDUCATION

- BSc Computer Science, National Open University of Nigeria | Expected April 2028 (studying while working)
- Previous academic background: Medical Laboratory Science (healthcare domain knowledge)

CERTIFICATIONS & CONTINUOUS LEARNING

NIST AI Bootcamp (AI Risk & Safety Frameworks) | AI Engineering & Backend Development (Udemy) | Backend Engineering & Systems Design (self-directed)
